

The Spine Education & Research Center (SERC) is equipped with state-of-the-art recording and distance learning equipment. This is not standard recording to a hard drive or tape but rather provides presentation protection, flexibility, distribution, as well as interactive streaming all from the same solution. Mediasite captures, encodes and synchronizes content from any video, audio and DVI/VGA devices your presenters choose to use (laptops, tablet PCs, whiteboards, document cameras and digital instrumentation). Mediasite will then encapsulate and allow for this content to be placed onto a DVD or streamed over the web while still protecting the presentation.

PROTECTION

Mediasite recording offers a protective environment that can be used to provide sensitive or confidential information in a manner that despite being distributed cannot be taken and used outside of its encapsulation. Once the recording is completed on the Mediasite recorders it is then placed into our server where the information is edited for length and time and is then published to either a DVD or web file.

FLEXIBILITY AND DISTRIBUTION

The Mediasite Player powers the most dynamic multimedia experience —unconstrained by traditional video and slide layouts. Your audience watches Mediasite presentations using their favorite browser from any PC or Mac, and control playback, choosing views that focus on the content most important to them. Mediasite also has the ability to stream live and on-demand. It allows presenters to present with no slide uploads, software installations or new technology to learn. Every Mediasite Player includes:

- User-controlled navigation
- Custom branding
- Interactive polls and Q&A
- Closed captioning support
